This C++ template-header-only library provides a general framework for epidemiologic simulation. The main features of the library are:

1. Four key classes: `Model`, `Person`, `Tool`, and `Virus`.
2. The model features a social networks of `Persons`.
3. `Persons` can have multiple `Tools` as a defense system.
4. `Tools` can reduce contagion rate, transmissibility, death rates, and improve recovery rates.
5. `Viruses` can mutate (generating new variants).
6. `Models` can feature multiple states, e.g., `HEALTHY`, `SUSCEPTIBLE`, etc.
7. `Models` can have an arbitrary number of parameters.
8. **REALLY FAST** About 6.5 Million person/day simulations per second.

### 4.2 Algorithm

Setup

- Create viruses.
- Create tools (arbitrary).
- Set model parameters (arbitrary).
- Create global events (e.g., surveillance).
- Set up the population: small world network (default).
- Set up rewiring (optional).
- Set states (arbitrary number of them).

## Run

1. Distribute the tool(s) and virus(es)
2. For each t in 1 -> Duration:
  - Update state for susceptible/infected/removed(?)
  - Mutate virus(es) (each individual)

## Chapter 6

### model1

The dynamics of the simulation process are:

1. Discrete Markov process.

2. The simulation has the following parameters:

a. New variant emergence at rate  $X$ . b. For each variant  $k$ :

- Unvaccinated individuals become sick rate  $C(k)$ ,
- Mortality rate  $D(k)$ ,
- Recovery rate  $H(k)$ ,
- Vaccines have an efficacy rate  $E(v, k)$  and pseudo vaccines (recovered) have efficacy rate  $E(r, k) < E(v, k)$ . In general, the probability of  $i$  acquiring the disease  $k$  from  $j$  will be equal to

```  $P(i \text{ gets the disease from } j \mid \text{their states}) = C(k) * (1 - E(i, k)) * (1 - E(j, k))$  ```

where  $(i, j) \in (u, v, r)$ . Efficacy rate for unvaccinated is zero.

- Vaccinated individuals have a reduced mortality rate  $D(k, v) > D(k)$ , and recovered individuals  $D(k, r) \in (D(k, v), D(k))$
- Vaccinated individuals have an increased recovery rate  $H(k, v) > H(k)$ , whereas recovered's rate  $H(k, r) \in (H(k), H(k, v))$ .

The sum of mortality and recovery rates is less than one since the difference represents no change.

c. Each country vaccinates citizens at rate  $V$  function of  $A$  (availability) and  $B$  (citizens' acceptance rate.) d. In each country  $i$ , the entire population  $N(i)$  distributes between the following states:

- Healthy unvaccinated ( $N(i, t, u)$ ),
- Healthy vaccinated ( $N(i, t, v)$ ),
- Deceased ( $N(i, t, d)$ ),
- Recovered ( $N(i, t, r)$ ),
- Unvaccinated and sick with variant ( $N(i, t, s, k|u)$ )  $k$ ., and
- Vaccinated and sick with variant ( $N(i, t, s, k|v)$ )  $k$ .

Total sick are  $N(i, t, k, s) = \sum(g \in \{u, v\}) N(i, t, k, s|g)$

Globally, we keep track of the prevalence of new variants. Variants can disappear if no more individuals port the variant, i.e., the prevalence rate  $P(k, t) = \sum(i) N(i, s, k)$  equals zero.

d. Vaccines are manufactured at each country at rates  $M(i)$  and uniformly shared with other countries at rate  $S(i)$ . c. Population flows between each country pair  $(i, j)$  at a rate  $F(i, j)$ . Flows between countries do not change Population and are symmetric.

3. The simulation process is as follows:

- (a) Countries are initialized with a total population  $N(i)$ .
- (b) Variant zero initializes at a random location  $i$ , with an initial prevalence  $P(k, t) = N(i, t, k)$ .
- (c) For time  $t$  in  $(0, T)$  do:
  - a. Unvaccinated individuals can become sick of variant  $k$  with probability:  

$$\Pr(h \rightarrow s | i, t, k, u) \sim \sum(g \in \{u, v\}) (N(i, t-1, s, k | g) + \sum(j \neq i) F(i, j) * N(j, t-1, s, k | g)) * C(k) / (N(i) + \sum(j \neq i) N(j))$$
  - b. Vaccinated individuals can become sick of variant  $k$  with probability:  $\Pr(v \rightarrow s | i, t, k, v) \sim \Pr(h \rightarrow s | i, t, k) * (1 - E(v, k))$ .
  - b. Recovered individuals can become sick of variant  $k$  with probability:  $\Pr(v \rightarrow s | i, t, k, r) \sim \Pr(h \rightarrow s | i, t, k) * (1 - E(r, k))$ .
  - c. Sick individuals with variant  $k$  die with probability  $D(k)$  or recover with probability  $H(k)$ , otherwise they stay infected; with the rates depending on their vaccination status  $v$  or  $n$ .
  - d. Unvaccinated individuals vaccinate in country  $i$  with probability  $P(u \rightarrow v) \sim V(A(i, t), B(i))$ .
  - e. The country vaccine supply changes.

## Chapter 7

# epiworld: A fast and flexible ABM framework for epidemiological

simulations George G. Vega Yon, Ph.D. 2024-04-05

`epiworld` is a fast and flexible agent-based modeling (ABM) framework for epidemiological simulations. Designed in C++, it can simulate large populations with complex interactions. The framework is designed to be modular, allowing users to extend and modify the model to suit their needs quickly. Besides the C++ library, an R package (`epiworldR`), a ShinyApp (`epiworldRShiny`), and a Python library (`epiworldpy`) are available to interact with the model.

### 7.1 Features

**Header-only:** `epiworld` is a header-only template library, making it easy to integrate into existing projects. It is distributed as a collection of files and as `a single header file`.

**A framework:** `epiworld` is designed to be a flexible framework for building epidemiological simulations. It provides a set of core components that can be easily extended and modified to suit the user's needs.

**Fast:** `epiworld` is designed for speed. It is implemented in C++ and uses efficient data structures and algorithms to ensure simulations dash. Furthermore, `epiworld` is designed to take advantage of multi-core processors, allowing simulations to be run in parallel (see the `benchmark section` for more details).

**Complex disease dynamics:** `epiworld` supports complex disease dynamics, including the evolution of the disease over time. For instance, diseases can accumulate mutations.

**Open-source:** With funding from the Centers for Disease Control and Prevention [CDC], `epiworld` is open-source and available under the MIT license, meaning it is entirely free. The source code is available on `GitHub`.

## 7.2 Example use cases

As a framework, epiworld can simulate various epidemiological scenarios. This section provides some possible use cases for the package:

- **Geographically informed models:** With the ability to model complex interactions between agents, the library can simulate geographically informed models featuring multiple regions with different populations and individuals moving between regions.
- **Non-pharmaceutical interventions (NPIs):** The library has been used to simulate NPIs featuring masking and social distancing. Furthermore, its architecture allows for deploying interventions that are reactive to the model's state, such as a mask mandate that only activates when the prevalence of the disease reaches a certain threshold.
- **Vaccination strategies:** The library can simulate different vaccination strategies, including prioritizing certain groups for vaccination, varying the vaccination rate, and modeling the impact of vaccine hesitancy.
- **Disease evolution:** The library can simulate the evolution of the disease over time, including the emergence of new variants and the impact of these variants on the spread of the disease.
- **Population comorbidities:** The library can model the impact of population comorbidities on the spread of the disease, including how different comorbidities affect the transmission and severity of the disease.

## 7.3 Appendix

### 7.3.1 Code example

The following code snippet shows a simple example of how to use epiworld to simulate an epidemic, particularly the Susceptible-Infected-Recovered model [SIR]:

```
#include "epiworld.hpp"
using namespace epiworld;
int main()
{
    // epiworld already comes with a couple
    // of models, like the SIR
    epimodels::ModelSIR<> hello(
        "COVID-19", // Name of the virus
        0.01,        // Initial prevalence
        0.9,         // Transmission probability
        0.3          // Recovery probability
    );
    // We can simulate agents using a small-world network
    // with 100,000 individuals, in this case
    hello.agents_smallworld(100000, 4L, false, .01);
    // Running the model and printing the results
    // Setting the number of days (100) and seed (122)
    hello.run(100, 122);
    hello.print();
    return 0;
}
```

The output could look something like the following:

```
Running the model...
||||| done.

### 7.3.2 Speed benchmark

### 7.3.3 Implementation

## Chapter 8

# EPI Simulator

### 8.1 Disease dynamics

Diseases continuously evolve in time. Changes in their genetic sequence make them more or less resistant to the particular version of the vaccine. Mutations also affect the transmissibility level and mortality rate of the disease. Using this approach allows making vaccination efficacy a function of compatibility between the variant and the vaccine.

When an individual becomes infected, the disease accumulates mutations in the new host. Ultimately, there is no single version of the disease present in the model, but rather an infinite number of them, each slightly different from the other.

### 8.2 Network dynamics

We can assume that the Population is organized in fully connected blocks for the first version of the model. Block sizes and the number of connections between blocks are Poisson random variables. Individuals interact with all the members of their blocks, and bridging individuals allow the disease to move across blocks.

### 8.3 Contagion dynamics

The transmission of the disease will be governed by the number of vaccinated, infected, and recovered within each block. Transmission between blocks will be treated in the same way, although individuals bridging the block will only interact with others within the block and their direct connections across the blocks.

### 8.4 Time dynamics

Time dynamics has two components, how biology evolves and how agents react.

The model develops as a continuous-time Markov process. Each block of individuals takes action at rates  $L(i|N(i))$  function of the local number of infections. This way, if

## 8.5 Updating agent's status

Like most other components, updating agents' states can be personalized. A naive approach allows agents to get infected with a single virus or stay as-is. The probability of this event is conditional on acquiring at most one virus. Since these are independent events, the conditional probability is computed as follows:

$$\begin{aligned} P(\text{Variant } k | \text{at most 1}) &= P(\text{at most 1} | \text{Variant } k) * P(\text{Variant } k) / P(\text{at most 1}) \\ &= P(\text{only variant } k) / P(\text{variant } k) * P(\text{Variant } k) / P(\text{at most 1}) \\ &= P(\text{only variant } k) / P(\text{at most 1}) \end{aligned}$$

Where

$$\begin{aligned} P(\text{only variant } k) &= P(k) * \text{Prod}(m \neq v) (1 - P(m)) \\ P(\text{at most 1}) &= P(\text{None}) + \text{Sum}(v \text{ in variants}) P(v) * \text{Prod}(m \neq v) (1 - P(m)) \\ P(\text{None}) &= \text{Prod}(v \text{ in variants}) (1 - P(v)) \end{aligned}$$

Furthermore, the (Variant, Person) pairs are treated independently.

### 8.5.1 Other parameters

- Who did you get the infection from.
- Omicron is 1.5 more infectious than delta.
- Surveillance:
  - Pull people to be tested at random.
  - Or at symptoms.
  - A mix of the two.
- Define a class for passing extra functions and datasets, for example, testing surveillance.
- Exposed people become infectious after k days.
- [Network](#) changes the can be a function of an ERGM. Apply K steps throughout time.
- Add progress bar.

#### 13.1.1 Detailed Description

Functions for sampling viruses.

#### 13.1.2 Function Documentation

##### 13.1.2.1 `make_sample_virus_neighbors()`

```
template<typename TSeq = int>
std::function<Virus<TSeq>*(Agent<TSeq>*,Model<TSeq>*)> epiworld::sampler::make_sample_virus_neighbors (
    std::vector< epiworld_fast_uint > exclude = {} ) [inline]
```

Make a function to sample from neighbors.

This is akin to the function `default_update_susceptible`, with the difference that it will create a function that supports excluding states from the sampling frame. For example, individuals who have acquired a virus can be excluded if in incubation state.

**Template Parameters**

<i>TSeq</i>	
-------------	--

**Parameters**

<i>exclude</i>	unsigned vector of states that need to be excluded from the sampling
----------------	----------------------------------------------------------------------

**Returns**

Virus<TSeq>\* of the selected virus. If none selected (or none available,) returns a nullptr;

**13.1.2.2 make\_update\_susceptible()**

```
template<typename TSeq >
std::function<void (Agent<TSeq>*, Model<TSeq>*)> epiworld::sampler::make_update_susceptible (
    std::vector< epiworld_fast_uint > exclude = {} ) [inline]
```

Make a function to sample from neighbors.

This is akin to the function `default_update_susceptible`, with the difference that it will create a function that supports excluding states from the sampling frame. For example, individuals who have acquired a virus can be excluded if in incubation state.

**Template Parameters**

<i>TSeq</i>	
-------------	--

**Parameters**

<i>exclude</i>	unsigned vector of states that need to be excluded from the sampling
----------------	----------------------------------------------------------------------

**Returns**

Virus<TSeq>\* of the selected virus. If none selected (or none available,) returns a nullptr;

**13.1.2.3 sample\_virus\_single()**

```
template<typename TSeq = int>
Virus<TSeq>* epiworld::sampler::sample_virus_single (
    Agent< TSeq > * p,
    Model< TSeq > * m ) [inline]
```

Sample from neighbors pool of viruses (at most one)

This function samples at most one virus from the pool of viruses from its neighbors. If no virus is selected, the function returns a `nullptr`, otherwise it returns a pointer to the selected virus.

This can be used to build a new update function (EPI\_NEW\_UPDATEFUN.)

## Template Parameters

<i>TSeq</i>	
-------------	--

## Parameters

<i>p</i>	Pointer to person
<i>m</i>	Pointer to the model

## Returns

Virus<TSeq>\* of the selected virus. If none selected (or none available,) returns a nullptr;

### 14.3.1 Detailed Description

```
template<typename TSeq>
class Agent< TSeq >
```

[Agent](#) (agents)

Template Parameters

<a href="#">TSeq</a>	Sequence type (should match TSeq across the model)
----------------------	----------------------------------------------------

### 14.3.2 Member Function Documentation

#### 14.3.2.1 operator()

```
template<typename TSeq >
double & Agent< TSeq >::operator() (
    size_t j ) [inline]
```

Access the j-th column of the agent.

If an external array has been specified, then these two functions can be used to access additional agent's features not included in the model.

The `operator[]` method is with no boundary check, whereas the `operator()` method checks boundaries. The former can result in a segfault.

## Parameters

<i>j</i>	
----------	--

## Returns

double&amp;

**14.3.2.2 swap\_neighbors()**

```
template<typename TSeq >
void Agent< TSeq >::swap_neighbors (
    Agent< TSeq > & other,
    size_t n_this,
    size_t n_other ) [inline]
```

Swaps neighbors between the current agent and agent *other*

## Parameters

<i>other</i>	
<i>n_this</i>	
<i>n_other</i>	

**14.3.3 Friends And Related Function Documentation****14.3.3.1 default\_rm\_entity**

template<typename TSeq >
void DataBase< TSeq >::record_virus (
    Virus< TSeq > & v ) [inline]
```

Registering a new variant.

**Parameters**

<b>v</b>	Pointer to the new virus. Since viruses are originated in the agent, the numbers simply move around. From the parent virus to the new virus. And the total number of infected does not change.

**14.7.2.7 reproductive\_number()**

```
template<typename TSeq >

Computes the reproductive number of each case.

By definition, whereas it computes  $R_0$  (basic reproductive number) or  $R_t/R$  (the effective reproductive number) will depend on whether the virus is allowed to circulate naïvely or not, respectively.

#### Parameters

<i>fn</i>	File where to write out the reproductive number.
-----------	--------------------------------------------------

#### 14.7.2.8 transition\_probability()

```
template<typename TSeq >

## 14.8.1 Detailed Description

```
template<typename TSeq>
class epiworld::DataBase< TSeq >
```

Statistical data about the process.

### Template Parameters

<i>TSeq</i>	
-------------	--

## 14.8.2 Member Function Documentation

### 14.8.2.1 generation\_time()

```
template<typename TSeq >
void DataBase< TSeq >::generation_time (
    std::vector< int > & agent_id,
    std::vector< int > & virus_id,
    std::vector< int > & time,
    std::vector< int > & gentime ) const [inline]
```

Calculates the generating time

### Parameters

<i>agent_id, virus_id, time, gentime</i>	vectors where to save the values agent_id
------------------------------------------	-------------------------------------------

### 14.8.2.2 get\_transmissions()

```
template<typename TSeq >
void DataBase< TSeq >::get_transmissions (
    std::vector< int > & date,
    std::vector< int > & source,
    std::vector< int > & target,
    std::vector< int > & virus,
    std::vector< int > & source_exposure_date ) const [inline]
```

Get the transmissions object.

#### Parameters

<i>date</i>	
<i>source</i>	
<i>target</i>	
<i>virus</i>	
<i>source_exposure_date</i>	

### 14.8.2.3 operator==( )

```
template<typename TSeq >
bool DataBase< TSeq >::operator==(
    const DataBase< TSeq > & other ) const [inline]
```

< Date of the transmission eve

< Id of the sour

< Id of the targ

< Id of the varia

< Date when the source acquired the varia

### 14.8.2.4 record\_virus()

```
template<typename TSeq >
void DataBase< TSeq >::record_virus (
    Virus< TSeq > & v ) [inline]
```

Registering a new variant.

## Parameters

<i>v</i>	Pointer to the new virus. Since viruses are originated in the agent, the numbers simply move around. From the parent virus to the new virus. And the total number of infected does not change.
----------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**14.8.2.5 reproductive\_number()**

```
template<typename TSeq >
MapVec_type< int, int > DataBase< TSeq >::reproductive_number [inline]
```

Computes the reproductive number of each case.

By definition, whereas it computes R0 (basic reproductive number) or Rt/R (the effective reproductive number) will depend on whether the virus is allowed to circulate naïvely or not, respectively.

## Parameters

<i>fn</i>	File where to write out the reproductive number.
-----------	--------------------------------------------------

**14.8.2.6 transition\_probability()**

```
template<typename TSeq >
std::vector< epiworld_double > DataBase< TSeq >::transition_probability (
    bool print = true ) const [inline]
```

Calculates the transition probabilities.

## Returns

`std::vector< epiworld_double >`

### Rewire the network preserving the degree sequence.

This implementation assumes an undirected network, thus if  $\{(i,j), (k,l)\} \rightarrow \{(i,l), (k,j)\}$ , the reciprocal is also true, i.e.,  $\{(j,i), (l,k)\} \rightarrow \{(j,k), (l,i)\}$ .

#### Parameters

------------	-----------------------------------

#### Returns

- [epiworld\\_double](#) **get\_rewire\_prop** () const
- void **rewire** ()

### Export the network data in edgelist form

fn	<i>std::string</i> . File name.
source	<i>Integer vector</i>
target	<i>Integer vector</i>

When passing the source and target, the function will write the edgelist on those.

- void **write\_edgelist** (std::string fn) const
- void **write\_edgelist** (std::vector< int > &source, std::vector< int > &target) const

proportions↔	<i>Vector of proportions for each state.</i>
—	
queue_	<i>Vector of queue for each state.</i>

- virtual **Model**< TSeq > & **initial\_states** (std::vector< double >, std::vector< int >)

**Setting and accessing parameters from the model**

*Tools* can incorporate parameters included in the model. Internally, parameters in the tool are stored as pointers to an *std::map<>* of parameters in the model. Using the *epiworld\_fast\_uint* method directly fetches the parameters in the order these were added to the tool. Accessing parameters via the *std::string* method involves searching the parameter directly in the *std::map<>* member of the model (so it is not recommended.)

The *par()* function members are aliases for *get\_param()*.

In the case of the function *read\_params*, users can pass a file listing parameters to be included in the model.

Each line in the file should have the following structure:

```
[name of parameter 1]: [value in double]
[name of parameter 2]: [value in double]
...
```

The only condition for parameter names is that these do not include a colon.

**Parameters**

initial_val	
pname	<i>Name of the parameter to add or to fetch</i>
fn	<i>Path to the file containing parameters</i>

**Returns**

*The current value of the parameter in the model.*

#### Parameters

proportions↔	Vector of proportions for each state.
—	
queue_	Vector of queue for each state.

- virtual [Model](#)< TSeq > & **initial\_states** (std::vector< double >, std::vector< int >)

### Setting and accessing parameters from the model

[Tools](#) can incorporate parameters included in the model. Internally, parameters in the tool are stored as pointers to an `std::map<>` of parameters in the model. Using the `epiworld_fast_uint` method directly fetches the parameters in the order these were added to the tool. Accessing parameters via the `std::string` method involves searching the parameter directly in the `std::map<>` member of the model (so it is not recommended.)

The `par()` function members are aliases for `get_param()`.

In the case of the function `read_params`, users can pass a file listing parameters to be included in the model. Each line in the file should have the following structure:

```
[name of parameter 1]: [value in double]
[name of parameter 2]: [value in double]
...
```

The only condition for parameter names is that these do not include a colon.

#### Parameters

### Returns

*The current value of the parameter in the model.*

- `epiworld_double` **add\_param** (`epiworld_double` initial\_val, `std::string` pname)

### Auxiliary variables for AgentsSample<TSeq> iterators

These variables+objects are used by the AgentsSample<TSeq> class for building efficient iterators over agents. The idea is to reduce the memory allocation, so only during the first call of AgentsSample<TSeq>::AgentsSample(Model<TSeq>) these vectors are allocated.

### 14.22.1 Detailed Description

```
template<typename TSeq>
class Model< TSeq >
```

Core class of epiworld.

The model class provides the wrapper that puts together [Agent](#), [Virus](#), and [Tools](#).

#### Template Parameters

<i>TSeq</i>	Type of sequence. In principle, users can build models in which virus and human sequence is represented as numeric vectors (if needed.)
-------------	-----------------------------------------------------------------------------------------------------------------------------------------

### 14.22.2 Member Function Documentation

#### 14.22.2.1 add\_globalevent()

```
template<typename TSeq >
void Model< TSeq >::add_globalevent (
    std::function< void(Model< TSeq > *)> fun,
    std::string name = "A global action",
    int date = -99 ) [inline]
```

Set a global action.

#### Parameters

<i>fun</i>	A function to be called on the prescribed date
<i>name</i>	Name of the action.
<i>date</i>	Integer indicating when the function is called (see details)

When date is less than zero, then the function is called at the end of every day. Otherwise, the function will be called only at the end of the indicated date.

#### 14.22.2.2 clone\_ptr()

```
template<typename TSeq >
Model< TSeq > * Model< TSeq >::clone_ptr [inline], [protected], [virtual]

Advanced usage: Makes a copy of data and returns it as undeleted pointer.

#### Parameters

<i>copy</i>	
-------------	--

```

Construct a new [Event](#) object.

#### Parameters

<i>agent_</i>	<a href="#">Agent</a> over which the action will be called
<i>virus_</i>	<a href="#">Virus</a> pointer included in the action
<i>tool_</i>	<a href="#">Tool</a> pointer included in the action

```
template<typename TSeq >
void Model< TSeq >::load_agents_entities_ties (
    std::string fn,
    int skip ) [inline]
```

### Public Member Functions

#### Construct a new ModelSURV object

The [ModelSURV](#) class simulates a surveillance model where agents can be isolated, even if asymptomatic.

#### Parameters

vname	<i>String. Name of the virus</i>
prevalence	<i>Integer. Number of initial cases of the virus.</i>
efficacy_vax	<i>Double. Efficacy of the vaccine (1 - P(acquire the disease)).</i>
latent_period	<i>Double. Shape parameter of a Gamma (latent_period, 1) distribution. This coincides with the expected number of latent days.</i>
infect_period	<i>Double. Shape parameter of a Gamma (infected_period, 1) distribution. This coincides with the expected number of infectious days.</i>
prob_symptoms	<i>Double. Probability of generating symptoms.</i>

*Parameters*

prop_vaccinated	<i>Double. Probability of vaccination. Coincides with the initial prevalence of vaccinated individuals.</i>
prop_vax_redux_transm	<i>Double. Factor by which the vaccine reduces transmissibility.</i>
prop_vax_redux_infect	<i>Double. Factor by which the vaccine reduces the chances of becoming infected.</i>
surveillance_prob	<i>Double. Probability of testing an agent.</i>
prob_transmission	<i>Double. Raw transmission probability.</i>
prob_death	<i>Double. Raw probability of death for symptomatic individuals.</i>
prob_noreinfect	<i>Double. Probability of no re-infection.</i>

### Get and set the state and queue

After applied, viruses can change the state and affect the queue of agents. These function sets the default values, which are retrieved when adding or removing a virus does not specify a change in state or in queue.

#### Parameters

init	After the virus/tool is added to the agent.
end	After the virus/tool is removed.
removed	After the agent ( <a href="#">Agent</a> ) is removed.

- void **set\_state** (epiworld\_fast\_int init, epiworld\_fast\_int end, epiworld\_fast\_int removed=-99)
- void **set\_queue** (epiworld\_fast\_int init, epiworld\_fast\_int end, epiworld\_fast\_int removed=-99)

```
template<typename TSeq>
class epiworld::Virus< TSeq >
```

[Virus](#).

#### Template Parameters

<a href="#">TSeq</a>	
----------------------	--

Raw transmissibility of a virus should be a function of its genetic sequence. Nonetheless, transmissibility can be

reduced as a result of having one or more tools to fight the virus. Because of this, transmissibility should be a function of the agent.
